

Summary of Session Findings for Session 3 (Projects and its Interoperability)

Rooshnie Velautham (260985875) – rooshnie.velautham@mail.mcgill.ca
Abhigyan Praveen (261047297) – abhigyan.praveen@mail.mcgill.ca

Functionality that worked

- The application worked as expected in most scenarios, and the response matched the expected outcomes explained in the documentations.
- All the instances of projects and their relationships were created as expected.

Instabilities/Concerns

- The usage of a POST is mostly reserved for the creation of an instance; however, this is not the case for projects. Both POST and PUT are behaving the same way, which is unnecessary.
- The application only permits you to create a project when you call POST on all the projects.
- When deleting an instance of a project or relationship, there is only a 200 OK response and nothing in the body. To verify if the deletion has been properly performed, we need to verify if the instance is present using GET.
