

Summary of Session Findings for Session 2 (Todo and Its Interoperability)

Abhijeet Praveen (260985492) - abhijeet.praveen@mail/mcgill.ca

Functionality that Worked

- The application performed as expected in most scenarios, responding appropriately to common API requests for documentation, todos, headers, and relationships (interoperability).
- Several API endpoints demonstrated interoperability, such as "tasksof" relationships and categories, indicating that these functions worked as intended.

Instabilities/Concerns

- Shutting down the application through just a GET request poses a security concern.
- There is an issue of ID incrementation on failed post requests may lead to unintended consequences when handling data.
- There is a lack of warnings when creating duplicate relationships could result in data inconsistencies.
- There is an absence of a response body during relationship creation may hinder troubleshooting.
